Definition

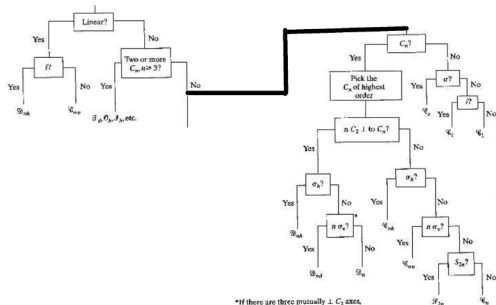

Point groups are groups of symmetry operations that keep at least one point in Euclidean space fixed.

Symmetry element of point groups:

- (i) Identity E
- (ii) n -fold rotation or symmetry axes C_n
- (iii) Reflection or symmetry or mirror planes σ
- (iv) n -fold rotation-reflection axis S_n (includes $i \equiv S_2$)
 - All point groups are subgroups of orthogonal group $O(N)$ (N is dimension)
 - Molecular point groups: $N = 3$
 - ▶ 7 axial group families: C_n , S_{2n} , C_{nh} , C_{nv} , D_n , D_{nd} , D_{nh}
 - ▶ 7 polyhedral group families: T , T_d , T_h , O , O_h , I , I_h

Determining Point Group Symmetry

1. Visualize the molecule (e.g. using a [simple web-based renderer](#))
2. Determine *all* symmetry elements
3. Follow the flow chart:

*If there are three mutually \perp C_2 axes, check each axis for two σ_v planes.

Water Molecule

- Symmetry elements of water: $\{E, C_2, \sigma_v, \sigma_{v'}\}$
- Point group C_{2v}

Group Multiplication Table

- Product of two symmetry operations $c = a \cdot b$: Apply b followed by a
- C_{2v} group (multiplication) table:

a b	E	C_2	σ_v	$\sigma_{v'}$
E	E	C_2	σ_v	$\sigma_{v'}$
C_2	C_2	E	$\sigma_{v'}$	σ_v
σ_v	σ_v	$\sigma_{v'}$	E	C_2
$\sigma_{v'}$	$\sigma_{v'}$	σ_v	C_2	E
